

# THE WESTERVIK MOTOR

## CRUDE OIL MARINE ENGINES

HEAVY-WEIGHT TYPE A 3—4, 4—5, 5—7 och 7—10 HP

**F**or small working vessels such as fishing- and pilot boats as well as pleasure boats in which the requirements call for steady running and reliability of the engine, we recommend the Westervik heavy-weight crude oil engines.

The Westervik heavy-weight crude oil engines are characterised by their ample dimensions and the fact that they are manufactured from specially selected materials to enable them to withstand the hard wear to which a working engine is frequently subjected.

The engine runs at a low speed, thus permitting a large, efficient propeller to be employed which ensures the highest possible speed range both for light and heavy boats.

Type A heavy-weight crude oil engines are built on the low pressure system without water injection; they are simply but strongly designed, they are economical in operation and give an appreciable power surplus.

All engines run in an anti-clockwise direction and have the silencer located on the port side (port side engines).

Type A heavy-weight crude oil engines are built in 4 sizes, namely, for 3—4, 4—5, 5—7 and 7—10 HP.
