

VMV

CRUDE OIL ENGINES

Type
A

MARINE - HEAVY

Our VMV Heavy Crude Oil Engines can be recommended for small work-boats, such as fishing and pilot boats, as well as for pleasure-boats, where a high degree of reliability is demanded.

VMV

Heavy Crude Oil Engines are of ample dimensions and manufactured from materials especially chosen to resist the heavy stresses to which a working engine is often subjected.

The engine has a low number of revolutions which enables to make the screw large and effective, in order to attain highest possible speed efficiency whether the engine is used in heavy or light boats.

VMV

Heavy Crude Oil Engines type A are built according to the low pressure system without water injection. They are of a simple but strong construction, economical in running, and deliver a great surplus power.

All engines run right-handedly. The exhaust box is placed on the port side (port engines).

VMV

Heavy Crude Oil Engines type A without water injection are manufactured in four sizes of 3—4, 4—5, 5—7, and 7—10 H. P.
